*Emerging Substances:

BTMPS (Tinuvin®)

BTMPS is an industrial chemical not intended for use in humans or animals. It is used as a protective coating in plastics to prevent breakdown from UV rays. At this time, side effects from BTMPS in humans are not well known.

Ortho-fluorofentanyl

A synthetic opioid and fentanyl analog that has increasingly been detected in the illicit drug supply. The specific side effects of this analog are currently unclear, but there is limited CDC research that suggests fluorofentanyls are likely similar to other illicitly manufactured fentanyls.

Pregabalin (Lyrica®)

Pregabalin is commonly used to treat nerve pain (fibromyalgia). As a prescription medication, there are known adverse side effects and negative drug interactions to consider, including respiratory depression.

Trending Substances

- In April 2024, xylazine was detected in every sample collected. Since then, there has been a significant decrease while there has also been a significant increase in medetomidine detected.
- Surprisingly, in November there was a peak of xylazine detection, but the following months continued the trend of increases in medetomidine and decreases in xylazine.
