*Emerging Substances:

Methamphetamine

A powerful synthetic stimulant with high addiction potential, capable of producing short-term euphoria, alertness, and energy but frequently causes increased/irregular heart rate, paranoia, and anxiety. It is a DEA Schedule II drug.

N,N-Dimethylamphetamine

An amphetamine class illegal stimulant drug, with similar but more mild and weaker effects then methamphetamine. However, it retains a high potential for abuse, is a DEA Schedule I drug, and has no accepted medical uses in the US.

Trending Substances

- While the most prevalent compounds stayed consistent in April, there was a slight increase in xylazine and decrease in medetomidine overall.
- There has been a recent rise in samples containing stimulants such as cocaine and methamphetamine. At the same time, the overall percentage of polysubstance fentanyl samples was lower. It is too early to tell if this indicates a decline in fentanyl in the drug supply more broadly.
