*Substance Highlight:

Medetomidine

Like xylazine, medetomidine is a veterinary tranquilizer not approved for human use, but it is considered to be more potent. Common adverse side effects are sedation, bradycardia, and severe withdrawal symptoms.

Tetracaine

Local anesthetics (commonly Lidocaine, Procaine, and Tetracaine) can increase the severity of other responses to illicit drugs, and at high levels (toxicity) can trigger their own symptoms, like seizures. Tetracaine has a longer duration effect than other local anesthetics and is commonly seen with medetomidine in street drug samples.

#2026-02

Trending Substances

- No new substances were identified last month. However, fentanyl, medetomidine, and tetracaine were most commonly detected. Tetracaine remains the most prominent local anesthetic.
- Over the last few months, there has been a notable decline in the presence of xylazine in samples tested. Last month was the lowest detection rate of xylazine in all of 2025.
- It is important to note that there was a significantly smaller sample size than previous months.
